"Cloning and expression of cDNA for O-acetylation of GD3
ganglioside.";
BIOPHYS. RES. COMMUN. 225:932-938(1996).
-!- FUNCTION: MAY BE INVOLVED IN PHOSPHOLIPID BINDING. SEEMS TO
PARTICIPATE IN THE O-ACETYLATION OF GD3 GANGLIOSIDE SIALIC
-!- SUBCELLULAR LOCATION: PERIPHERAL MEMBRANE PROTEIN.
-!- TISSUE SPECIFICITY: SPLEEN, LUNG, HEART, BRAIN AND MUSCLE.
-!- SIMILARITY: CONTAINS 2 EGF-LIKE DOMAINS.

-! FUNCTION: PROBABLY ASSOCIATES WITH PHOSPHOLIPIDS ON THE SURFACE MAMMARY EPITHELIAL CELLS AND MILK FAT GLOBULES. ZONA PELLUCIDA-BINDING PROTEIN.

-!- TISSUE SPECIFICITY: MILK AND SPERMATOZOAN.

-!- ALTERNATIVE PRODUCTS: THERE EXIST 2 VARIANTS DUE TO ALTERNATIVE SPLICING; THE SHORTER FORM LACKS 53 AMINO ACIDS WITHIN THE F5/8 TYPE C 1 DOMAIN.

-!- SIMILARITY: CONTAINS 2 EGF-LIKE DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   MEDLINE;

SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
TISSUE SPECIFICITY: DEVELOPING NERVOUS SYSTEM; OPTIC TECTUM
(LAYERS D AND E OF SGFS), AMACRINE CELLS OF RETINA, NEURITES OF
DORSAL ROOT GANGLIA. ALSO EXPRESSED IN NONNEURONAL CELLS, E.G.
BLOOD VESSELS IN THE ENTIRE EMBRYO.
SIMILARITY: CONTAINS 2 CUB DOMAINS.
SIMILARITY: CONTAINS 2 F5/8 TYPE C DOMAINS.
SIMILARITY: CONTAINS 1 MAM DOMAIN.

The SQN mutant is created by fusing Ser-743 to Gln-1638 of native Factor VIII (see W44373) to form a Ser-Gln-Asn (SQN) link between the A2 and A3 Factor VIII domains. A DNA sequence encoding the SQN deletion mutant is provided in V15338. When compared to plasmid-derived Factor VIII, the SQN deletion does not influence the in vivo pharmacokinetics, but the reduced size of the molecule appears to decrease proteolytic degradation. The invention relates to preparations of replication defective recombinant retrovirus (RV) expressing a B domain-deleted human Factor VIII protein, where the recombinant RV is capable of the recombinant RV is cap
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (CHIR ) CHIRON CORP.

          Example 28; Pages 213-217; 272pp; English.

CC This is the beta-domain deleted SQN deletion protein of human factor VIII. The encoding DNA is used to construct recombinant retroviral vectors expressing human factor VIII. The invention provides the preparation of replication defective recombinant retrovirus (RRV) complements and is capable of inducing long term degradation by human complement and is capable of inducing long term complement and is capable of inducing long term complement and is capable of inducing long term complements and is capable of inducing long term complements. The long term systemic expression results in a measurable level of the therapeutic protein when administered intravenously to a human. The long term systemic expression results in a measurable level of the therapeutic protein being produced in the blood of the human for a period of at least 30 days after the administration of the rapeutic protein being produced in the blood of the rapeutic protein to treat, e.g. haemophilia A, haemophilia B, thrombosis, hypercoagulable disorders, liver diseases such as hepatitis, cd disorders such as thalassemia, phenylketonuria, Lesch-Nyhan syndrome, severe combined immunodeficiency (SCID), cystic fibrosis, Duchenne's Muscular Dystrophy, inherited emphysema, familial hypercholesterolemia, cd diabetes, hypopituitarism, adenine deaminase deficiency, alphal-cantitypsin deficiency, Guacher's syndrome, anaemia, infections such as construing inactivation in human serum thereby allowing efficient gene curvals for over prolonged periods of time.

CC secondore ver prolonged periods of time.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human factor VIII beta-domain deleted SQN deletion protein sequence. Replication defective; recombinant retrovirus; RRV; therapeutic protein; haemophilia; thrombosis; hypercoagulable disorder; liver disease; human; hepatitis; thalassemia; phenylketonuria; Lesch-Nyhan syndrome; diabetes; cystic fibrosis; Duchenne's Muscular Dystrophy; hypercholesterolemi; hypopituitarism; adenine deaminase deficiency, HIV infection; anaemia; hypopituitarism; high blood pressure; Alzheimer's disease, autoimmune inflammatory disease; factor VIII.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1441
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1381

                         PT regulatory element

PS Example 1; Pages 31-36; 59pp; English.

CC The present sequence represents human B-domain deleted factor VIII

CC The cDNA encoding this protein also contains, 3' of the coding region, a

CC post-translational regulatory element (PRE) of the Hepatitis B virus.

CC post-translational regulatory element (PRE) of the Hepatitis B virus.

CC post-translational regulatory element (PRE) of the Hepatitis B virus.

CC post-translational regulatory clament (PRE) of the Hepatitis B virus.

CC post-translational regulatory clament (PRE) of the Hepatitis B virus.

CC post-translational regulatory clament (PRE) of the Hepatitis B virus.

CC post-translation of the sement (PRE) of the Hepatitis B virus.

CC post-translating countain regulatory clament (PRE) of the Hepatitis B virus.

CC equences is part of a novel vector, comprising an intronless gene

CC apromoter sequence so that the gene is transcribed in a cell.

CC Intronless gene transcripts which contain near consensus splice site

CC sequences are believed to get tied up in the nucleus of the cell where

CC sequences are believed to get tied up in the nucleus of the cell where

CC along with the gene, causing export of the gene transcript from the

CC along with the gene, causing export of the gene transcript from the

CC conclusions into the cytoplasm of the cell. The vector can be used

CC to increase the expression of an intronless gene containing at least one

CC accomplex allows the targeted

CC ligand is an asialoglycoprotein which binds the asialoglycoprotein

CC recenter present on their curface
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Bidlingmaier S, Il
WPI; 97-470874/43.

CC The protein is a fusion between Phe 742 and Ser 1637 of the factor
CC The protein is a fusion between Phe 742 and Ser 1637 of the factor
CC The protein is a fusion between Phe 742 and Ser 1637 of the factor
CC The protein (factor VIII:SQ). In order to produce a
CC factor VIII deletion derivative that can be produced in vivo and/or
CC in vitro, to a two chain protein consisting of polypeptide chains of
CC 90 kD and 80 kD, the amino acid sequences surrounding Arg 740 and
CC arg 1648 have to be conserved in order to preserve the structural
CC requirements for correct cleavage. In this example, amino acids 743
CC 1636 of the full-length factor VIII polypeptide are deleted. A
CC new polypeptide chain is obtd. where there are 14 amino acids
CC linking Arg 740 and Arg 1648. Of these 14 amino acids, the sequence
CC of the five N-terminal ones directly corresponds to the five amino
CC of the five N-terminal amino acids of the above 14 amino acids fragment
CC directly corresponds to the 12 amino acids preceding Glu 1689 in full-
CC length factor VIII, thus creating a 3 amino acid overlap between the
CC N- and C-terminal regions of the B-domain.
CC haemophilia A. It has the biological characteristics of plasma derived
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         R12971 standa

```

sequence was in the amino acid fig. descript:

order to index this example, the factor VIII:QD amino acid quence was retrieved from WO8800831 (P80265).

amino acid numbering in the above comments is reproduced from . description in the specification. Note that  ${\tt Arg}\ 740$  is  ${\tt Arg}\ 7$

PT New DNA sequences encoding modified factor VIII:C - with deletion of DNA encoding maturation polypeptide, useful for high yield transformation. Claim 3; Page 51-52-53-54; 97pp; English.

CC A major part of the sequence encoding the maturation polypeptide of factor VIII:C is deleted, i.e. Gln 744 - Asp 1563. The QD deletion retains approximately 90 amino acids of the maturation polypeptide (four amino acids at the N-terminal end and 86 amino acids at the C-terminal end). The full lenght Factor VIII:C cDNA has two changes with respect to the published sequence (EPO application 160457): CC CTG to CTA at Leu 242 and TTC to CTC change at amino acid residue 1880 (Phe to Leu).

CC The product is produced in approx. 20 times higher casily purified. The peptide is used for treating haemophilia A, both cacute and prolonged bleeding.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ΔÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             В
PT encoding maturation polypeptide, useful for high yield transformation.

PS Claim 3; Page 57-58-59-60; 97pp; English.

CC The entire sequence encoding the maturation polypeptide of cator VIII:C is deleted, i.e. Arg 740-Glu 1649.

CC The full lenght Factor VIII:C cDNA has two changes with respect to the published sequence (EPO application 160457):

CC CTG to CTA at Leu 242 and TTC to CTC change at amino acid residue 1880 (Phe to Leu). The product is produced in approx. 20 times higher yields than previous recombinant produced factor VIII:C and are more easily purified. The peptide is used for treating haemophilia A, both acute and prolonged bleeding.

New DNA sequences encoding modified factor VIII:C - with deletio encoding maturation polypeptide, useful for high yield transforma claim 3; Page 60-61-62-63; 97pp; English.

The RD deletion removes the DNA from Ser 741 to Ser 1657.

A major part of the sequence encoding the maturation polypeptide factor VIII:C is deleted, i.e. Gln 744 - Asp 1563.

The full lenght Factor VIII:C CDNA has two changes with respect to CDNA in the sequence (EPO application 160457):

CTG to CTA at Leu 242 and TTC to CTC change at amino acid residue (Phe to Leu). The product is produced in approx. 20 times higher yields than previous recombinant produced factor VIII:C and are must be sequence in the peptide is used for treating haemophilia A, 1 caute and prolonged bleeding.

Sequence 1424 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Qy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        prodn. of recombinant human Factor-VIII-C - using animal cells transformed with a vector contg. the gene for Pr Factor VIII:C and a promoter Pr Factor VIII:C and a promoter Pr Figure 1(1) - 1(13); ; 32pp; English.

CC Arg-740 of the carboxyl terminus of the H chain is CC directly bonded by a peptide bond to Glu-1649 of the amino terminus of L chain. A prefd. expression vector used to transform animal cell so that they produce human Factor VIII:Cis plasmid Ad.RE.neo.

CC The expression vector has at least one promoter upstream of n90654.

CC The transformants can constantly and continuously produce human Factor VIII:C in high yield on a commercial scale. The human Factor VIII:C so produced is considered to corresp. to the smallest species of active and intact Factor VIII:C molecules in the human blood plasma. It is useful for treating haemophilia A patients.

PT Hybrid Factor VIII with modified activity, comprises region from PT donor anticoagulant or antithrombotic protein - useful for treatment of coagulation disorders
PT of coagulation disorders
CC Claim 11; Page 52-60; 96pp; English.
CC Factor VIII-dB695-HCII (W18670) is a hybrid protein in which amino CC acids 712-736 of Factor-dB695 (Factor VIII de1868-1562) B-domain CC are replaced by amino acids 51-80 from the acidic region (and CC potential thrombin-binding site) of human heparin cofactor II (HCII). It is the expression product of Factor VIII-dB695-HCII CC (HCII). It is plasmid pCLB-dB695-HCII. The hybrid protein, which CC DNA (T69811) in plasmid pCLB-dB695-HCII. The hybrid protein, which CC can be expressed using gene therapy techniques, has increased procoagulant activity owing to the HCII acidic region, and can be used to treat blood coagulation disorders such as haemophilia A. Sequence 1661 AA;

Modified human pro-coagulant active fa administered to haemophiliacs, i.e. fa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             30-APR-1998 (first entry)
Procoagulant-active human factor VIII:C (FVIII) mutant
Pro-coagulant active factor VIII; FVIII; haemophilia A;
recombinant secretion; pro-coagulant activity; resistan
activated protein C cleavage; APC; B domain; A2 domain;
von Willebrand factor binding site; binding affinity;
FVIII replacement therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      W33227

Claim 20; Page -; 57pp; English.

The present sequence represents a novel pro-coagulant active factor VIII (FVIII) mutant protein, comprising a deletion of the B domain a von Willebrand factor binding site, a mutation at Arg740 and an addition of an amino acid sequence spacer between the A2 and A3 domains race
                                                                                                                                                                                                                                                                                                                                                                                                                       Domain
                                                                                                                                                                                                                                                                                                                                                                                                                                         Region

VIII, along with calcium and phospholipid, acts as a cofactor for factor IXA, when it converts factor X to the activated form (factor XA). FVIII is the coagultion factor deficient in the X-chromosome-linked bleeding disorder haemophilia A. Several other mutant FVIII proteins have also been created (see W33222-29). The FVIII mutant F309S (W33225) is capable of recombinant secretion at higher levels than typically obtained with wild type FVIII and retains pro-coagulant activity. The FVIII mutant CC (ABC) cleavage. The present FVIII mutant can form a more stable configuration, and have an approximate 5-fold increase in specific activity compared to purified wild type FVIII, while increasing their binding affinity to von Willebrand factor improves their stability. The FVIII proteins can be administered to haemophiliacs, i.e. FVIII crease therapy, while the nucleic acid molecule can be used for the FVIII proteins.

                                                                                                                                                                                                                                                   The present sequence represents a novel pro-coagulant active factor CC VIII (FVIII) mutant protein, comprising a deletion of the B domain and von Willebrand factor binding site, mutations F309S, R740A and addition viii, along with calcium and phospholipid, acts as a cofactor for factor VIII, along with calcium and phospholipid, acts as a cofactor for factor IXA, when it converts factor to the activated form (factor XA). FVIII IXA, when it converts factor to the activated form (factor XA). FVIII IXA, when it converts factor to the activated form (factor XA). FVIII IXA, when it converts factor to the activated form (factor XA). FVIII IXA, when it converts factor to the activated form (factor XA). FVIII IXA, when it converts factor to the activated form (factor XA). FVIII IXA, when it converts factor intended in FVIII proteins have also been created (see W332229). The FVIII mutant F309S (W33225) is capable of recombinant secretion at higher levels than typically obtained with the CC (APC) cleavage. The present FVIII mutant activity. The FVIII mutant CC (APC) cleavage. The present FVIII mutant can form a more stable configuration, and have an approximate 5-fold increase in specific activity compared to purified wild type FVIII, while increasing their binding affinity to von Willebrand factor improves their stability. The FVIII proteins can be administered to haemophiliacs, i.e. FVIII can therefore therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PS Claim 18; page -; 57pp; English.

CThe present sequence represents a novel pro-coagulant active factor VIII (FVIII) mutant protein, comprising a deletion of the B domain and CC von Willebrand factor binding site, mutations R33G1, R562K and R740A and CC an addition of an amino acid sequence spacer between the A2 and A3 CC domains. Factor VIII, along with calcium and phospholipid, acts as a CC cofactor for factor IXA, when it converts factor X to the activated form CC (factor XA). FVIII is the coagultion factor deficient in the CC representation of the B domain and coagulant composition factor X to the activated form CC (factor XA). FVIII mutant secretion at higher levels than CC rylically obtained with wild type FVIII and retains pro-coagulant composition of the B domain and von Willebrand factor comprising a deletion of the B domain and von Willebrand factor binding site, a mutation at Arg740 and an addition of an amino acid configuration, and have an approximate 5-fold increase in specific activity compared to purified wild type FVIII, while increasing their CC indiguration, and have an approximate 5-fold increase in specific activity compared to purified wild type FVIII, while increasing their CC replacement therapy, while the nucleic acid molecule can be used for cene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

PS Claim 27; Page -; 90pp; English.

CC W11330-W11472 represent active Factor VIII:C analogues of the invention.

CC These sequences were created by mutating the wild type Factor VIII:C

CC coding sequence (see T51357) using mutagenic primers. The analogues

CC coding sequence (see T51357) using mutagenic primers. The analogues

CC coding sequence (see T51357) using mutagenic primers. The analogues

CC coding sequence (see T51357) using mutagenic primers. The analogues

CC coding sequence (see T51357) using mutagenic primers. The analogues

CC coding sequence (see T51357) using mutagenic primers. The analogues

CC created. Factor VIII:C polypeptide modified at a site adjacent

CC created. Factor VIII:C is a large glycoprotein that participates in the

blood coagulation cascade that ultimately converts soluble fibrinogen to

CC insoluble fibrin clot, effecting haemostasis. A deficiency in Factor

CC VIII:C is responsible for haemophilia A, which is an X-chromosome-linked

CC viii:C is responsible for haemophilia A, which is an X-chromosome-linked

CC viii:C is responsible for haemophilia A, which is an X-chromosome-linked

CC cleaved to generate heavy and light chain fragments that are further

CC cleaved. Complexes of two or more of the analogues, nucleic acids and

CC cleaved. Complexes of two or more of the analogues, nucleic acids and

CC cleaved. Complexes of two or more of the analogues, nucleic acids and

CC other, for the prevention or treatment of active Factor VIII:C deficiency

in a mammal. The analogues may be used as immunogens to raise antibodies,

and in the treatment of haemophiliacs, by improvement of haemostasis. The

analogues are resistant to proteolytic cleavage and display increased

CC different modes of administration.

CC Wili30-Wili472 represent active Factor VIII:C analogues of the invention.

CC These sequences were created by mutating the wild type Factor VIII:C

CC coding sequence (see T51357) using mutagenic primers. The analogues

CC coding sequence (see T51357) using mutagenic primers. The analogues

CC comprise a native Factor VIII:C polypeptide modified at a site adjacent

CC comprise a native Factor VIII:C polypeptide modified at a site adjacent

CC created. Factor VIII:C is a large glycoprotein that participates in the

blood coagulation cascade that ultimately converts soluble fibrinogen to

insoluble fibrin clot, effecting haemostasis. A deficiency in Factor

CC vili:C is responsible for haemophilia, which is an X-chromosome-linked

inherited bleeding diathesis. Factor VIII:C is activated by plasma

proteases, such as thrombin. During activation the mature polypeptide is

Cleaved to generate heavy and light chain fragments that are further

CC cleaved to generate heavy and light chain fragments that are further

CC cleaved to proteon them may be used alone or in conjunction with each

CC other, for the prevention or treatment of active Factor VIII:C deficiency

in a mammal. The analogues may be used as immunogens to raise antibodies,

cand in the treatment of haemophiliacs, by improvement of haemostasis. The

cc analogues are resistant to proteolytic cleavage and display increased

CC plasma half-life. They may be administered at lower dosages and by

cc different modes of administration.
                                                                                                                                                                                                                                                                                                 8888888888

PS Claim 25; Page -; 90pp; English.

CC W11330-W11472 represent active Factor VIII:C analogues of the invention.

CC These sequences were created by mutating the wild type Factor VIII:C

CC coding sequence (see T51357) using mutagenic primers. The analogues

CC comprise a native Factor VIII:C polypeptide modified at a site adjacent

CC to a non-activating Arg residue so that a Arg-Pro or Pro-Arg dipeptide is

CC created. Factor VIII:C is a large glycoprotein that participates in the

blood coagulation cascade that ultimately converts soluble fibrinogen to

CC insoluble fibrin clot, effecting haemostasis. A deficiency in Factor

CC VIII:C is responsible for haemophilia A, which is an X-chromosome-linked

CC inherited bleeding diathesis. Factor VIII:C is activated by plasma

CC plasmed: Complexes of two or more of the analogues, nucleic acids and

CC cleaved to generate heavy and light chain fragments that are further

CC cleaved. Complexes of two or more of the analogues, nucleic acids and

CC other, for the prevention or treatment of active Factor VIII:C deficiency

in a mammal. The analogues may be used as immunogens to raise antibodies,

CC analogues are resistant to proteolytic cleavage and display increased

CC plasma half-life. They may be administered at lower dosages and by

SQ Sequence 2344 AA;
